1 Functions

25 May 2023

1.1 Functions. Domain of Definition

The independent variable x is defined by a set X of its values. If to each value of the independent variable $x \in X$ there corresponds one definite value of another variable y, then y is called the function of x with a domain of definition (or domain) X or, in functional notation, y = y(x), or y = f(x), or $y = \varphi(x)$, and so forth. The set of values of the function y(x) is called the range of the given function.

1.2 Investigation of Functions

A function f(x) defined on the set X is said to be nondecreasing on this set (respectively, increasing, nonincreasing, decreasing), if for any numbers $x_1, x_2 \in$ $X, x_1 < x_2$ the inequality $f(x_1) \leq f(x_2)$ (respectively, $f(x_1) < f(x_2), f(x_1) \ge f(x_2), f(x_1) > f(x_2)$ is satisfied. The function f(x) is said to be monotonic on the set X if it possesses one of the four indicated properties. The function f(x) is said to be bounded above (or below) on the set X if there exists a number M(or m) such that $f(x) \leq M \ \forall \ x \in X$. The function f(x) is said to be bounded on the set X if it is bounded above and below. The function f(x) is called periodic if there exists a number T > 0 such that f(x+T) = f(x) for all x belonging to the domain of definition of the function (together with any point x the point x+T must belong to the domain of definition). The least number T possessing this property (if such a number exists) is called the period of the function f(x). The function f(x) takes on the maximum value at the point $x_o \in X$ if $f(x_o) \ge f(x)$ for all $x \in X$, and the minimum value if if $f(x_o) \leq f(x)$ for all $x \in X$. A function f(x) defined on a set X which is symmetric w.r.t origin of coordinates is called even if f(-x) = f(x), and odd if f(x) = -f(x).

1.3 Inverse of Function

Let the function y = f(x) be defined on the set X and have a range Y. If for each $y \in Y$ there ex-

ists a single value of x such that f(x) = y, then this correspondence defines a certain function x = g(y) called inverse w.r.t given function y = f(x). The sufficient condition for the existence of an inverse function is a strict monotony of the original function y = f(x). If the function increases (decreases), then the inverse function also increases (decreases). The graph of the inverse function x = g(y) coincides with that of the function y = f(x) if the independent variable is marked off along the y - axis. If the independent variable is laid off along the x-axis,i. e. if the inverse function is written in the form y = g(x), then the graph of the inverse function will be symmetric to that of the function y = f(x) with respect to the bisector of the first and third quadrants.

2 Limits

2.1 Existence

Limit of function f(x) is said to exist as $x \to a$ when,

$$\lim_{h \to 0^+} f(a - h) = \lim_{h \to 0^+} f(a + h)$$

equal to some finite value L.

2.2 Indeterminate forms

There are only seven indeterminate forms $\frac{0}{0}, \frac{\infty}{\infty}, 0 \times \infty, \infty - \infty, \infty^0, 0^0 \text{ and } 1^{\infty}.$

2.3 List of limits

Limits Operations

If $\lim_{x\to c} f(x) = L$

- $\lim_{x\to c} [f(x\pm a)] = L \pm a$
- $\lim_{x\to c} af(x) = aL$
- $\lim_{x\to c} \frac{1}{f(a)} = \frac{1}{L}$ for L>0
- $\lim_{x\to c} f(x)^n = L^n$ for n>0

Involving infinitesimal changes

If infinitesimal change h if denote by Δx . If f(x) and g(x) are differentiable at x.

- $\lim_{h\to 0} \frac{f(x+h)-f(x)}{h} = f'(x)$
- $\lim_{h\to 0} \frac{f \circ g(x+h) f \circ g(x)}{h} = f'[g(x)]g'(x)$
- $\bullet \lim_{h \to 0} \frac{f(x+h)g(x+h) f(x)g(x)}{h} = f'(x)g(x) + f(x)g'(x)$
- $\bullet \ \lim\nolimits_{h\to 0} \big(\frac{f(x+h)}{f(x)} \big)^{\frac{1}{h}} = exp\big(\frac{f'(x)}{f(x)} \big)$
- $\lim_{h\to 0} \left(\frac{f(e^h x)}{f(x)}\right)^{\frac{1}{h}} = exp\left(\frac{xf'(x)}{f(x)}\right)$
