# 1 Functions

25 May 2023

# 1.1 Functions. Domain of Definition

The independent variable x is defined by a set X of its values. If to each value of the independent variable  $x \in X$  there corresponds one definite value of another variable y, then y is called the function of x with a domain of definition (or domain) X or, in functional notation, y = y(x), or y = f(x), or  $y = \varphi(x)$ , and so forth. The set of values of the function y(x) is called the range of the given function.

# 1.2 Investigation of Functions

A function f(x) defined on the set X is said to be nondecreasing on this set (respectively, increasing, nonincreasing, decreasing), if for any numbers  $x_1, x_2 \in$  $X, x_1 < x_2$  the inequality  $f(x_1) \leq f(x_2)$  (respectively,  $f(x_1) < f(x_2), f(x_1) \ge f(x_2), f(x_1) > f(x_2)$ is satisfied. The function f(x) is said to be monotonic on the set X if it possesses one of the four indicated properties. The function f(x) is said to be bounded above (or below) on the set X if there exists a number M(or m) such that  $f(x) \leq M \ \forall \ x \in X$ . The function f(x) is said to be bounded on the set X if it is bounded above and below. The function f(x) is called periodic if there exists a number T > 0 such that f(x+T) = f(x) for all x belonging to the domain of definition of the function (together with any point x the point x+T must belong to the domain of definition). The least number T possessing this property (if such a number exists) is called the period of the function f(x). The function f(x) takes on the maximum value at the point  $x_o \in X$  if  $f(x_o) \ge f(x)$  for all  $x \in X$ , and the minimum value if if  $f(x_o) \leq f(x)$  for all  $x \in X$ . A function f(x) defined on a set X which is symmetric w.r.t origin of coordinates is called even if f(-x) = f(x), and odd if f(x) = -f(x).

#### 1.3 Inverse of Function

Let the function y = f(x) be defined on the set X and have a range Y. If for each  $y \in Y$  there ex-

ists a single value of x such that f(x) = y, then this correspondence defines a certain function x = g(y) called inverse w.r.t given function y = f(x). The sufficient condition for the existence of an inverse function is a strict monotony of the original function y = f(x). If the function increases (decreases), then the inverse function also increases (decreases). The graph of the inverse function x = g(y) coincides with that of the function y = f(x) if the independent variable is marked off along the y - axis. If the independent variable is laid off along the x-axis,i. e. if the inverse function is written in the form y = g(x), then the graph of the inverse function will be symmetric to that of the function y = f(x) with respect to the bisector of the first and third quadrants.

# 2 Limits

# 2.1 Existence

Limit of function f(x) is said to exist as  $x \to a$  when,

$$\lim_{h \to 0^+} f(a - h) = \lim_{h \to 0^+} f(a + h)$$

equal to some finite value L.

# 2.2 Indeterminate forms

There are only seven indeterminate forms  $\frac{0}{0}, \frac{\infty}{\infty}, 0 \times \infty, \infty - \infty, \infty^0, 0^0 \text{ and } 1^{\infty}.$ 

#### 2.3 List of limits

#### **Limits Operations**

If  $\lim_{x\to c} f(x) = L$ 

- $\lim_{x\to c} [f(x\pm a)] = L \pm a$
- $\lim_{x\to c} af(x) = aL$
- $\lim_{x\to c} \frac{1}{f(a)} = \frac{1}{L}$  for L>0
- $\lim_{x\to c} f(x)^n = L^n$  for n>0

#### Involving infinitesimal changes

If infinitesimal change h if denote by  $\Delta x$ . If f(x) and g(x) are differentiable at x.

• 
$$\lim_{h\to 0} \frac{f(x+h)-f(x)}{h} = f'(x)$$

• 
$$\lim_{h\to 0} \frac{fog(x+h)-fog(x)}{h} = f'[g(x)]g'(x)$$

• 
$$\lim_{h\to 0} \frac{f(x+h)g(x+h)-f(x)g(x)}{h} = f'(x)g(x) + \inf_{x\to 0} \left(\frac{e^{ax}-1}{x}\right) = a$$

• 
$$\lim_{h\to 0} \left(\frac{f(x+h)}{f(x)}\right)^{\frac{1}{h}} = exp\left(\frac{f'(x)}{f(x)}\right)$$

$$\bullet \ \lim\nolimits_{h\to 0}(\frac{f(e^hx)}{f(x)})^{\frac{1}{h}}=exp(\frac{xf'(x)}{f(x)})$$

If f(x) and g(x) are differentiable on an open interval containing c, except possibly c itself, and  $\lim_{x\to c} f(x) = \lim_{x\to c} g(x) = 0 \text{ or } \pm \infty.$ 

Jean Bernoulli or L'Hopital's rule can be used:

$$\lim_{x \to c} \frac{f(x)}{g(x)} = \frac{f'(x)}{g'(x)}$$

#### Inequalities

If  $f(x) \leq g(x)$  for all x in interval that contains c, except possibly c itself, and the limit of f(x) and g(x) both exist at c, then  $\lim_{x\to c} f(x) \leq \lim_{x\to c} g(x)$ If  $\lim_{x\to c} f(x) = \lim_{x\to c} h(x) = L$  and

$$f(x) \le g(x) \le h(x)$$

for all x in an open interval that contains c, except possibly c itself,  $\lim_{x\to c} g(x) = L$ . This is know as  $Squeeze\ Theorem.$ 

# Exponential Functions

Function of form  $f(x)^{g(x)}$ 

• 
$$\lim_{x \to +\infty} \left(\frac{x}{x+k}\right)^x = e^{-k}$$

• 
$$\lim_{x\to 0} (1+x)^{\frac{1}{x}} = e$$

$$\bullet \lim_{x \to 0} (1 + kx)^{\frac{m}{x}} = e^{mk}$$

• 
$$\lim_{x \to +\infty} (1 + \frac{1}{x})^x = e$$

• 
$$\lim_{x \to +\infty} (1 - \frac{1}{x})^x = \frac{1}{e}$$

• 
$$\lim_{x \to +\infty} (1 + \frac{k}{x})^{mx} = e^{mk}$$

• 
$$\lim_{x\to 0} (1 + a(e^{-x} - 1)^{-\frac{1}{x}}) = e^a$$

#### Sum products and Composites

• 
$$\lim_{x\to 0} \left(\frac{a^x-1}{x}\right) = \ln a$$

$$\bullet \lim_{x \to 0} \left( \frac{e^x - 1}{x} \right) = 1$$

$$\bullet \lim_{x \to 0} \left( \frac{e^{ax} - 1}{x} \right) = a$$

# 2.5 Logarithmic Functions

• 
$$\lim_{x\to 1} \frac{\ln x}{x-1} = 1$$

• 
$$\lim_{x\to 0} \frac{\ln(x+1)}{x} = 1$$

$$\bullet \lim_{x \to 0} \frac{-ln(1+a(e^{-x}-1))}{x} = a$$

#### Some cases

• 
$$\lim_{x\to 0^+} log_b x = -F(b)\infty$$

• 
$$\lim_{x\to\infty} log_b x = F(b)\infty$$

where F(x) = 2H(x-1)-1 and H(x) is Oliver Heaviside step function.

# **Trigonometric Functions**

• 
$$\lim_{x\to 0} \frac{\sin ax}{ax} = 1$$
 for  $a \neq 0$ 

• 
$$\lim_{x\to 0} \frac{\sin ax}{bx} = \frac{a}{b}$$
 for  $b \neq 0$ 

• 
$$\lim_{x\to\infty} x \sin(\frac{1}{x}) = 1$$

• 
$$\lim_{x\to 0} \frac{\tan ax}{ax} = 1$$
 for  $a \neq 0$ 

• 
$$\lim_{x\to 0} \frac{\tan ax}{bx} = \frac{a}{b}$$
 for  $b\neq 0$ 

#### 2.7 Sums

• 
$$\lim_{x\to\infty} \sum_{k=1}^n \frac{1}{k} = \infty$$

• 
$$\lim_{x\to\infty} (\sum_{k=1}^n \frac{1}{k} - logn) = \gamma$$
. This is Euler Mascheroni Constant.

# **Notable Special Limits**

• 
$$\lim_{x \to \infty} \frac{n}{\sqrt[n]{n!}} = e$$

• 
$$\lim_{x\to\infty} 2^n \sqrt{2 - \sqrt{2 + \sqrt{2 + \dots + \sqrt{2}}}} = \pi$$

# 2.9 Taylor Series

$$\begin{split} e^x &= 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \ldots + \infty \\ \ln(1+x) &= x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \ldots + \infty \\ \ln(1-x) &= -(x + \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \ldots + \infty) \\ \ln(\frac{1+x}{1-x}) &= 2(x + \frac{x^3}{3} + \frac{x^5}{5} + \frac{x^7}{7} + \ldots) \\ \sin x &= x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \ldots + \infty \\ \cos x &= 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \ldots + \infty \\ \cos x &= 1 + \frac{x^3}{3} + \frac{2x^5}{15} + \ldots + \infty \\ \sec x &= x + \frac{x^2}{2} + \frac{5x^4}{24} + \ldots + \infty \\ \arcsin x / \sin^{-1} x &= x + \frac{x^3}{6} + \frac{3x^5}{40} + \ldots + \infty \\ \arccos x / \cos^{-1} x &= \frac{\pi}{2} - (x + \frac{x^3}{6} + \frac{3x^5}{40} + \ldots) \\ \arctan x / \tan^{-1} x &= x - \frac{x^3}{3} + \frac{x^5}{5} + \ldots + \infty \end{split}$$

# 3 Differentiation

26 May 2023

# 3.1 Elementary functions

$$\bullet \ \frac{d}{dx}(x^n) = nx^{n-1}$$

• 
$$\frac{d}{dx}(a^x) = a^x lna$$

• 
$$\frac{d}{dx}(lnx) = \frac{1}{x}$$

• 
$$\frac{d}{dx}(log_a x) = \frac{1}{xlna}$$

• 
$$\frac{d}{dx}(sinx) = cosx$$

• 
$$\frac{d}{dx}(cosx) = -sinx$$

• 
$$\frac{d}{dx}(secx) = secxtanx$$

• 
$$\frac{d}{dx}(cosecx) = -cosecxcotx$$

• 
$$\frac{d}{dx}(tanx) = sec^2x$$

• 
$$\frac{d}{dx}(cotx) = -cosec^2x$$

# 3.2 Basic Theorems

• 
$$\frac{d}{dx}(f \pm g) = f'(x) \pm g'(x)$$

• 
$$\frac{d}{dx}(kf(x) = k\frac{d}{dx}(f(x)))$$

• 
$$\frac{d}{dx}(f(x).g(x)) = f(x)g'(x) + g(x)f'(x)$$

$$\bullet \ \frac{d}{dx} \left( \frac{f(x)}{g(x)} \right) = \frac{g(x)f'(x) - g'(x)f(x)}{g^2(x)}$$

• 
$$\frac{d}{dx}(f(g(x))) = f'(g(x))g'(x)$$

# 3.3 Inverse Trigonometric Functions

• 
$$\frac{d}{dx}(sin^{-1}x) = \frac{1}{\sqrt{1-x^2}}$$

$$\bullet \ \frac{d}{dx}(\cos^{-1}x) = \frac{-1}{\sqrt{1-x^2}}$$

$$\bullet \ \ \tfrac{d}{dx}(tan^{-1}x) = \tfrac{1}{1+x^2}$$

$$\bullet \ \frac{d}{dx}(\cot^{-1}x) = \frac{-1}{1+x^2}$$

$$\bullet \ \frac{d}{dx}(sec^{-1}x) = \frac{1}{|x|\sqrt{x^2-1}}$$

• 
$$\frac{d}{dx}(cosec^{-1}x) = \frac{-1}{|x|\sqrt{x^2-1}}$$

# 3.4 Using Substitution

• 
$$\sqrt{x^2 + a^2} \implies x = atan\theta$$

• 
$$\sqrt{a^2 - x^2} \implies x = a sin \theta$$

• 
$$\sqrt{x^2 - a^2} \implies x = asec\theta$$

• 
$$\sqrt{\frac{x+a}{a-x}} \implies x = a\cos\theta$$

#### 3.5 Parametric Differentiation

If  $y = f(\theta)$  and  $x = g(\theta)$  where  $\theta$  is parameter then

$$\frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}}$$

# 3.6 Derivative of Determinant

# 4 Application of Derivatives

# 4.1 Equation of Tangent and Normal

Tangent at  $(x_1, y_1)$  is given by

$$(y - y_1) = f'(x_1)(x - x_1)$$

when  $f'(x_1)$  is real and Normal at  $(x_1, y_1)$  is given by

$$(y - y_1) = \frac{-1}{f'(x_1)}(x - x_1)$$

when  $f'(x_1)$  is non-zero and real.

# Tangent from an external point

Given a point  $\delta(a,b)$  which does not lie on the curve y=f(x) then equation of possible tangents to the curve y=f(x) passing through (a,b) can be found by solving for point of contact  $\lambda$ 

$$f'(h) = \frac{f(h) - b}{h - a}$$

and equation of tangent

$$y - b = \frac{f(h) - b}{h - a}(x - a)$$

# Length of tangent, normal, sub-tangent, sub-normal from point $\sigma(h, k)$ and slope m

Length of Tangent =  $|k|\sqrt{1 + \frac{1}{m^2}}$ 

Length of Normal =  $|k|\sqrt{1+m^2}$ 

Length of Sub-Tangent =  $\left|\frac{k}{m}\right|$ 

Length of Sub-Normal = |km|

Angle between the curves

$$tan\theta = |\frac{m_1 - m_2}{1 + m_1 m_2}|$$

#### 4.2 Theorems

#### Rolle's Theorem

If a function f defined on [a, b] and

- continuous on [a, b]
- derivable on (a, b)
- f(a) = f(b)

then there exists at least one real number c between a and b (a < c < b) such that f'(c) = 0.

# Lagrange's Mean Value Theorem

If a function f defined on [a, b] and

- continuous on [a, b]
- derivable on (a, b)

then there exists at least one real number c between a and b (a < c < b) such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

#### Cauchy's Mean Value theorem

If functions f and g defined on [a, b] and

- continuous on [a, b]
- derivable on (a, b)
- $c \in (a, b)$  then

$$\frac{f'(c)}{g'(c)} = \frac{f(b) - f(a)}{g(b) - g(a)}$$
